CONTENTS

FOREWORD.....	3
INTRODUCTION.....	5
1 Scope.....	6
2 Normative references	6
3 Terms, definitions and abbreviated terms	6
3.1 Terms and definitions.....	6
3.2 Abbreviated terms.....	6
4 Background of the software defined networking and its control plane for optical nodes	7
5 Research activities on high-performance node systems where intermediate controller plays key role.....	7
5.1 Photonic network with OpenFlow® controller	7
5.2 Dynamic optical path network with a network controller.....	7
5.3 Control interface of the Photonic Layer-2	8
6 Intermediate controller for multiple dynamic module systems.....	8
6.1 Description of the controller	8
6.1.1 Controller of multiple dynamic modules for a network node.....	8
6.1.2 Structure of the intermediate controller	9
6.2 Functions	10
6.3 Shared information between the control interface and the network control plane	11
7 Example of multi-degree ROADM systems.....	12
8 Conclusion	14
Bibliography.....	15
Figure 1 – Conceptual block of the control interface for multiple dynamic modules and network devices	8
Figure 2 – Basic block of the control interface for multiple dynamic modules.....	9
Figure 3 – Difference between connection information and configuration information	10
Figure 4 – Function coverage of the intermediate controller	11
Figure 5 – Example of a multiple dynamic module system.....	12
Figure 6 – Example of 4-degree ROADM node architecture	13
Figure 7 – 3-degree ROADM node with colourless, non-directional add/drop ports.....	13
Figure 8 – Compact PLC-based transponder aggregator for colourless and directionless ROADM.....	14
Table 1 – Shared information in the intermediate controller.....	12

INTERNATIONAL ELECTROTECHNICAL COMMISSION

DYNAMIC MODULES –**Part 6-10: Design guide – Intermediate controller
for multiple dynamic module systems****FOREWORD**

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a technical report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

IEC TR 62343-6-10, which is a technical report, has been prepared by subcommittee 86C: Fibre optic systems and active devices, of IEC technical committee TC 86: Fibre optics.

The text of this technical report is based on the following documents:

Enquiry draft	Report on voting
86C/1381/DTR	86C/1422/RVC

Full information on the voting for the approval of this technical report can be found in the report on voting indicated in the above table.

This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 62343 series, published under the general title *Dynamic modules*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

Software defined networking (SDN) technology is widely recognized as a promising solution for flexible and efficient provisioning of networks by virtualizing their infrastructures, which results in cost-effective realization of high capacity, low energy consumption and even low latency. SDN technology will remain highly influential over global industries, societies, and the environment for many years to come.

Optical fibre communication technology has offered sufficient transport capacity with a fixed physical topology. However, recent technological progress in optical networking enables physical reconfiguration of optical paths by controlling multiple dynamic modules such as wavelength division multiplexing (WDM) devices and switching devices. Here, the key is to have an intermediate controller that controls and maintains the multiple dynamic modules in an integrated fashion, according to the upper layer controller of the SDN.

In order to realize such a reconfigurable and/or dynamically switchable optical network infrastructures at a hardware level in a cost-effective, reliable, scalable and low-carbon manner, it is important to initiate, in a timely manner and to a wide extent, conceptual and technical discussions, particularly on the intermediate controller for future standardization.

It is very important for industries to identify requirements for network architecture and devices/components in a timely manner, and to improve the technology development and investment efficiencies.

The objective of this part of IEC 62343 is to contribute to the standardization of basic requirements of the dynamic optical path networks using the intermediate controller.

DYNAMIC MODULES –

Part 6-10: Design guide – Intermediate controller for multiple dynamic module systems

1 Scope

This part of IEC 62343, which is a Technical Report, discusses the rationale, conceptual definition, and minimum list of functions for an intermediate controller that delivers a dynamic control signal to multiple dynamic modules. These modules are included in an optical-switch-based network node, according to the upper layer controller of software-defined optical networking.
