CONTENTS

FOREWORD.....	11
INTRODUCTION.....	13
1 Scope.....	15
2 Normative references	15
3 Terms, definitions, abbreviations, acronyms and symbols	20
3.1 Terms and definitions.....	20
3.2 Abbreviations and acronyms	25
3.3 Network diagram symbols	32
4 Wide Area Communication in electrical utilities	34
4.1 Executive summary.....	34
4.2 Use Case: ENDESA, Andalusia (Spain)	36
4.3 Typical interface between a substation and the WAN	38
4.4 WAN characteristics and actors	39
4.5 SGAM Mapping	40
4.6 Network elements and voltage level	42
4.7 WAN interfaces in substation automation (IEC 61850-5).....	43
4.8 Logical interfaces and protocols in the TC57 Architecture IEC TR 62357	44
4.9 Network traffic and ownership.....	45
5 WAN overall requirements and data transmission metrics.....	45
5.1 Traffic types.....	45
5.2 Quality of Service (QoS) of TDM and PSN	46
5.3 Latency calculation	46
5.3.1 Latency components.....	46
5.3.2 Propagation delay.....	46
5.3.3 Residence delay	47
5.3.4 Latency accumulation.....	47
5.3.5 Example: latency of a microwave system	47
5.3.6 Latency and determinism.....	47
5.3.7 Latency classes in IEC 61850-5.....	48
5.4 Jitter.....	50
5.4.1 Jitter definition.....	50
5.4.2 Jitter classes in IEC 61850	51
5.5 Latency symmetry and path congruency	51
5.6 Medium asymmetry	51
5.7 Communication speed symmetry.....	52
5.8 Recovery delay	52
5.9 Time accuracy	52
5.9.1 Time accuracy definition	52
5.9.2 Time accuracy classes.....	53
5.10 Tolerance against failures	54
5.10.1 Failure	54
5.10.2 Reliability.....	54
5.10.3 Redundancy principles.....	55
5.10.4 Redundancy and reliability.....	55
5.10.5 Redundancy checking.....	56
5.10.6 Redundant layout: single point of failure	57

5.10.7	Redundant layout: cross-redundancy	57
5.10.8	Maintainability	58
5.10.9	Availability	58
5.10.10	Integrity	60
5.10.11	Dependability	62
5.10.12	Example: Dependability of GOOSE transmission	62
6	Applications analysis	62
6.1	Application kinds	62
6.2	Teleprotection (IF2 & IF11)	63
6.2.1	Teleprotection schemes	63
6.2.2	Teleprotection data kinds	64
6.2.3	Teleprotection requirements for latency	64
6.2.4	Teleprotection requirements for latency asymmetry	64
6.2.5	Teleprotection requirements for integrity	64
6.2.6	Teleprotection summary	65
6.3	Telecontrol (IF1, IF6)	65
6.4	Substation to control centre (IF10)	66
6.5	CMD (IF7)	67
6.5.1	CMD overview	67
6.5.2	CMD communication requirements	67
6.6	Control Centre to Control Centre (IF12)	67
6.7	Wide Area Monitoring System (IF13)	68
6.7.1	WAMS overview	68
6.7.2	WAMS topology	68
6.7.3	WAMS communication requirements	70
6.8	Wide area monitoring, protection and control (WAMPAC) IF13	71
6.8.1	WAMPAC overview	71
6.8.2	WAMPAC communication requirements	71
6.8.3	Use case WAMPAC	73
6.9	Wind turbines and wind virtual power plants	74
6.10	Distributed Energy and Renewables (DER)	74
6.11	Summary of communication requirements for WAN	74
7	Wide-area and real-time network technologies	75
7.1	Introduction	75
7.2	Topology	75
7.3	Overview	76
7.4	Layer 1 (physical) transmission media	78
7.4.1	Summary	78
7.4.2	Installation guidelines	78
7.4.3	Metallic lines	79
7.4.4	Power line carrier (PLC)	80
7.4.5	Radio transmission	84
7.4.6	Fiber optics	89
7.4.7	Layer 1 redundancy	96
7.4.8	Use case: Diverse redundancy against extreme contingencies (Hydro-Quebec)	97
7.4.9	Layer 1 security	98
7.5	Layer 1,5 (physical) multiplexing	98
7.6	Layer 2 (link) technologies	99

7.6.1	Telephony technologies	99
7.6.2	SDH/SONET	101
7.6.3	Optical Transport Network	111
7.6.4	Ethernet	112
7.6.5	Ethernet over TDM	122
7.6.6	Carrier Ethernet	123
7.6.7	Audio-Video Bridging	125
7.6.8	Provider Backbone Bridge (PBB)	125
7.6.9	Multiprotocol Label Switching (MPLS)	127
7.7	Layer 3 (network) technologies	135
7.7.1	Internet Protocol (IP)	135
7.7.2	IP QoS	148
7.7.3	IP multicast	151
7.7.4	IP redundancy	152
7.7.5	IP security	152
7.7.6	IP communication for utilities	154
7.7.7	IP summary	156
7.8	Layer 4 (transport) protocols	157
7.8.1	Transport layer encapsulation	157
7.8.2	UDP	157
7.8.3	TCP	158
7.8.4	Layer 4 redundancy	159
7.8.5	Layer 4 security	159
7.9	Layer 5 (session) and higher	159
7.9.1	Session layer	159
7.9.2	Routable GOOSE and SMV	160
7.9.3	Example: C37.118 transmission	160
7.9.4	Session protocol for voice and video transmission	161
7.9.5	Application interface redundancy	161
7.9.6	Application device redundancy	162
7.10	Protocol overlay – tunneling	162
7.10.1	Definitions	162
7.10.2	Tunneling principle	163
7.10.3	Tunneling Layer 2 over Layer 3	163
7.10.4	Use Case: Tunneling GOOSE and SMV in IEC 61850	164
7.10.5	Circuit emulation service (CES)	165
7.11	Virtual Private Networks (VPNs)	169
7.11.1	VPN principles	169
7.11.2	L2VPNs	169
7.11.3	L2VPN multicast on MPLS	171
7.11.4	L3VPN	171
7.11.5	VPN mapping to application	173
7.12	Cyber Security	176
7.12.1	Security circles	176
7.12.2	Network security	177
7.12.3	Access Control	180
7.12.4	Threat detection and mitigation	180
7.12.5	Security architecture	184
7.12.6	Application (end-to-end) communication security	185

7.12.7	Security for synchrophasor (PMU) networks (IEC TR 61850-90-5)	186
7.12.8	Additional recommendations	187
7.13	QoS and application-specific engineering	187
7.13.1	General	187
7.13.2	SDH/SONET QoS and SLA	187
7.13.3	PSN QoS and SLA	187
7.13.4	Application and priority	188
7.13.5	QoS chain between networks	188
7.13.6	QoS mapping between networks	189
7.13.7	QoS engineering	190
7.13.8	Customer restrictions	191
7.13.9	Clock services	191
7.14	Configuration and OAM	191
7.14.1	Network configuration	191
7.14.2	OAM	191
7.15	Time synchronization	193
7.15.1	Oscillator stability	193
7.15.2	Mutual synchronization	193
7.15.3	Direct synchronization	194
7.15.4	Radio synchronization	194
7.15.5	GNSS synchronization	195
7.15.6	Frequency distribution	195
7.15.7	Time distribution	196
7.15.8	PTP telecommunication profiles	203
7.15.9	PTP over MPLS	203
7.15.10	Comparison of time distribution profiles based on IEC 61588	203
7.15.11	Use Case: Synchrophasor time synchronization	205
7.15.12	Use case: Atomic Clock Hierarchy	205
8	Use cases	206
8.1	Use case: Current differential teleprotection system (Japan)	206
8.2	Use case: SDH / MPLS network (Japan)	210
8.3	Use Case: Wide area stabilizing control system (Japan)	211
8.4	Use Case: experimental PMU-based WAMPAC system	213

INTERNATIONAL ELECTROTECHNICAL COMMISSION

COMMUNICATION NETWORKS AND SYSTEMS FOR POWER UTILITY AUTOMATION –

Part 90-12: Wide area network engineering guidelines

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a technical report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

IEC TR 61850-90-12, which is a technical report, has been prepared by IEC technical committee 57: Power systems management and associated information exchange.

The text of this technical report is based on the following documents:

Enquiry draft	Report on voting
57/1536/DTR	57/1576/RVC

Full information on the voting for the approval of this technical report can be found in the report on voting indicated in the above table.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all parts in the IEC 61850 series, published under the general title *Communication networks and systems for power utility automation*, can be found on the IEC website.

The committee has decided that the contents of this publication will remain unchanged until the stability date indicated on the IEC website under "<http://webstore.ch>" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

A bilingual version of this publication may be issued at a later date.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

Utilities use data networks to interconnect equipment between their premises, over distances from under a kilometer to thousands of kilometers, called a “Wide Area Network” of WAN.

WANs encompass communication means of different nature (optical, radio, power line carrier, copper, etc.), with a variety of topologies (rings, trees, meshes, etc.), using different protocols (SDH/SONET, Ethernet, IP, MPLS, etc.), medium sharing (packet switching, time division multiplex, etc.) and for different applications (teleprotection, SCADA, voice, video, etc.).

This contrasts with substation automation networks as described in the LAN Engineering Guidelines (IEC TR 61850-90-4), which are based on one technology (switched Ethernet), make extensive use of Layer 2 multicast (GOOSE, SMV, PTP, etc.) and use Layer 3 communication (MMS, FTP, etc.), typically without routers within the substation.

The IEC 61850 suite sets up numerous requirements on the network but does not state how to achieve them:

- IEC 61850-5 specifies the basic requirements for data networks used in Power Utility Automation networks;
- IEC 61850-7 focuses on data modelling, leaving out physical interconnection details;
- IEC 61850-8-1 and IEC 61850-9-2 specify interoperable communication within substations;
- IEC TR 61850-90-1 describes substation-to-substation traffic, specifies the requirements for communication, defines object models for substation-to-substation teleprotection, models the gateway and the tunneler, but leaves the WAN undefined;
- IEC TR 61850-90-2¹ provides substation to control centre network configuration for IEDs, proxies and applications;
- IEC TR 61850-90-5 (synchrophasor transmission) addresses the transport of synchrophasor data between PMUs and control centres and defines a tunneling protocol as well as a data security method;
- IEC TR 61850-90-4 provides guidelines for network engineering focused on Ethernet-based real-time and highly available networks in substations. Some of these guidelines are applicable to networks outside of the substation;
- IEC 60870-6 (TASE2), IEC 61968 and IEC 61970 (CIM) describe the information interchange at the application layer without specifying the network.

Each of these documents deals separately with application, transport or network layer mechanism. There exist no comprehensive engineering guides for wide-area and real-time networks for control and protection. The growing success of IEC 61850 calls for guidelines for engineering the WANs.

Complementing IEC TR 61850-90-4, this Technical Report proposes guidelines for wide-area and real-time networks for various IEC 61850-based applications including teleprotection, wide area measurement, protection and control (WAMPAC), power system monitoring (WASA, WAMS), operation SCADA, and condition monitoring and diagnosis (CMD) and non-operational traffic.

This Technical Report is based on existing standards for semantics, services, protocols, system configuration language and architecture. It is based on work done by various IEC working groups including:

- Power system IED communication and associated data models;

¹ To be published.

- Energy management system application program interface;
- Data and communications security;
- Interoperability within TC 57 in the long term;
- Industrial networks;
- Highly Available Automation Networks.

Contributions were included from:

- IEEE 802.1 WG (Higher layer LAN protocols);
- IEEE 1588 WG (Precise Networked Clock Synchronization);
- IEEE Power System Relaying Committee (PSRC);
- UCA International Users Group;
- The North American Synchrophasor Initiative (NASPI);
- CEN/CENELEC/ETSI Smart Grids Coordination Group;
- CIGRE working groups D2.26, D2.28, D2/B5.30, D2.35; and
- Different utilities, providers and research institutes, in particular the Central Research Institute of Electric Power Industry (Japan), Hydro-Quebec [50]² (Canada), Swissgrid (Switzerland) and ENEL (Italy).

² Numbers in square brackets refer to the bibliography.

COMMUNICATION NETWORKS AND SYSTEMS FOR POWER UTILITY AUTOMATION –

Part 90-12: Wide area network engineering guidelines

1 Scope

This Technical Report is intended for an audience familiar with electrical power automation based on IEC 61850 and particularly for data network engineers and system integrators. It is intended to help them to understand the technologies, configure a wide area network, define requirements, write specifications, select components and conduct tests.

This Technical Report provides definitions, guidelines, and recommendations for the engineering of WANs, in particular for protection, control and monitoring based on IEC 61850 and related standards.

This Technical Report addresses substation-to-substation communication, substation-to-control centre and control centre-to-control centre communication. In particular, this Technical Report addresses the most critical aspects of IEC 61850 such as protection related data transmission via GOOSE and SMVs, and the multicast transfer of large volumes of synchrophasor data.

The Technical Report addresses issues such as topology, redundancy, traffic latency and quality of service, traffic management, clock synchronization, security and maintenance of the network.

This Technical Report contains use cases that show how utilities tackle their WAN engineering.
