INTRODUCTION 2
1 Scope 8
2 Normative references 8
3 Terms and definitions 8
4 Symbols 13
5 General 15
6 Requirements of the measurement system 15
6.1 Apparatus configuration 15
6.2 Measurement water tank 15
6.3 ~~Fixturing~~ Fixing, positioning and orientation systems 16
6.4 Reflector 16
6.5 Current monitor (probe) 16
6.6 Oscilloscope 16
6.7 Measurement hydrophone 16
7 Measurement of the effective half-aperture of the spherically curved transducer 17
7.1 Setup 17
7.2 Alignment and positioning of the hydrophone in the field 17
7.3 Measurements of the beamwidth and the effective half-aperture 17
7.4 Calculations of the focus half-angle and the effective area 17
8 Measurements of the electroacoustical parameters and the acoustic output power 18
8.1 Self-reciprocity method for transducer calibration 18
8.1.1 Experimental procedures 18
8.1.2 Criterion for checking the linearity of the focused field 18
8.1.3 Criterion for checking the reciprocity of the transducer 18
8.2 Calculations of the transmitting response to current (voltage) and voltage sensitivity 18
8.3 Calculations of the transmitting response at geometric focus to current (voltage) 19
8.4 Calculation of the pulse-echo sensitivity level 20
8.5 Measurements of the radiation conductance and the mechanical quality factor Q_m 20
8.5.1 Calculations of the acoustic output power and the radiation conductance 20
8.5.2 Measurement of the frequency response of the radiation conductance 20
8.6 Measurement of the electroacoustic efficiency 21
8.6.1 Calculation of the electric input power 21
8.6.2 Calculation of the electroacoustic efficiency 21
8.7 Measurement of the electric impedance (admittance) 21
9 Measurement uncertainty 21
Annex A (informative) Relation of the average amplitude reflection coefficient on a plane interface of water-stainless steel and the focus half-angle for a normally incident beam of a circular spherically curved transducer [6],[7] 22
Annex B (informative) Diffraction correction coefficient G_{sf} in the free-field self-reciprocity calibration method for circular spherically curved transducers in water neglecting attenuation [7],[8],[9] 27

Annex C (informative) Calculation of the diffraction correction coefficient $G_{sf}(R/\lambda,\beta)$ in the free-field self-reciprocity calibration in a non-attenuating medium for a circular spherically curved transducer [7],[8],[9],[10] 29
Annex D (informative) Speed of sound and attenuation in water 32
D.1 General 32
D.2 Speed of sound for propagation in water [14] 32
D.3 Acoustic attenuation coefficient for propagation in water 33
Annex E (informative) Principle of reciprocity calibration for spherically curved transducers [7],[8],[9],[16],[17],[18],[19] 34
E.1 Principle of reciprocity calibration for an ideal spherically focused field of a transducer 34
E.2 Principle of reciprocity calibration of a real spherically focused field of a transducer 35
E.3 Self-reciprocity calibration of a spherically curved transducer 35
Annex F (informative) Experimental arrangements 41
F.1 Experimental arrangement for determining the effective radius of a transducer [7],[8],[9],[24] 41
F.2 Experimental arrangement of the self-reciprocity calibration method for a spherically curved transducer [8],[9],[24],[25] 41
Annex G (informative) Relationships between the electroacoustical parameters used in this application [24] 43
G.1 Relationship between the free-field transmitting response to voltage (current) and the voltage sensitivity with the radiation conductance 43
G.2 Relationship between the radiation conductance and the electroacoustic efficiency 44
G.3 Relationship between the transmitting response and voltage and acoustic output power 44
G.4 Relationship between the pulse echo sensitivity and the radiation conductance 44
Annex H (informative) Evaluation and expression of uncertainty in the measurements of the radiation conductance 45
H.1 Executive standard 45
H.2 Evaluation of uncertainty in the measurement of the radiation conductance 45
H.2.1 Mathematical expression 45
H.2.2 Type A evaluation of standard uncertainty 45
H.2.3 Type B evaluation of standard uncertainty 46
H.2.4 Evaluation of the combined standard uncertainty for the radiation conductance 49
Annex I (informative) Measurement range for power and pressure and examples of electroacoustical parameters obtained 52
I.1 Measurement range of acoustic pressure and power 52
I.1.1 Lower limit of acoustic power 52
I.1.2 Upper limit of pressure [27] 52
I.2 Calibrated example of electroacoustical parameters 53
I.2.1 1 MHz focusing transducer with air backing of diameter 80 mm and focal length 200 mm 53
I.2.2 5 MHz focusing transducer with air backing of diameter 20 mm and focal length 20 mm 54
Bibliography 55

ULTRASONICS – MEASUREMENTS OF ELECTROACOUSTICAL PARAMETERS AND ACOUSTIC OUTPUT POWER OF SPHERICALLY CURVED TRANSDUCERS USING THE SELF-RECIPROCITY METHOD

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
6) All users should ensure that they have the latest edition of this publication.
7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

This redline version of the official IEC Standard allows the user to identify the changes made to the previous edition IEC TS 62903:2018. A vertical bar appears in the margin wherever a change has been made. Additions are in green text, deletions are in strikethrough red text.

IEC TS 62903 has been prepared by IEC technical committee 87: Ultrasonics. It is a Technical Specification.

This second edition cancels and replaces the first edition published in 2018. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

a) Several quantities are recognized as complex-valued quantities in the definitions and in the main text.
b) Annex I was added to provide typical measurement ranges and to provide example calibration results.

The text of this Technical Specification is based on the following documents:

Draft	Report on voting
87/825/DTS	87/829/RVDTS

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Specification is English.

In this document, the following print types are used:

- terms defined in Clause 3: **in bold type**.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

An ultrasonic transducer is an important acoustic device that can act as a transmitter or a receiver in the applications of medical ultrasound, non-destructive testing, and ultrasonic materials processing. The performance of a transducer is a decisive factor that governs the device's range of applicability, efficiency and quality control in the manufacturing. The mechanisms, transmitting fields, performances, and measurement methods used for these transducers have been studied over the past few decades. However, the electroacoustical characterization and measurement methods applied for spherically curved transducers have not been defined in standard documents for either terms or protocols.

This document defines the relevant electroacoustical parameters for these devices and establishes the self-reciprocity measurement method for spherically curved concave focusing transducers.

ULTRASONICS – MEASUREMENTS OF ELECTROACOUSTICAL PARAMETERS AND ACOUSTIC OUTPUT POWER OF SPHERICALLY CURVED TRANSDUCERS USING THE SELF-RECIPROCITY METHOD

1 Scope

This document, which is a Technical Specification,

a) establishes the free-field convergent spherical wave self-reciprocity method for ultrasonic transducer calibration,

b) establishes the measurement conditions and experimental procedure required to determine the transducer's electroacoustic parameters and acoustic output power using the self-reciprocity method,

c) establishes the criteria for checking the reciprocity of these transducers and the linear range of the focused field, and

d) provides guiding information for the assessment of the overall measurement uncertainties for radiation conductance.

This document is applicable to:

i) circular spherically curved concave focusing transducers without a centric hole working in the linear amplitude range,

ii) measurements in the frequency range 0,5 MHz to 15 MHz, and

iii) acoustic pressure amplitudes in the focused field within the linear amplitude range.

Characterization and sensitivity calibration of hydrophones using the reciprocity method are not addressed in this document but covered in IEC 62127-2 [1][1] and IEC 60565-1 [2].

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

INTRODUCTION

An ultrasonic transducer is an important acoustic device that can act as a transmitter or a receiver in the applications of medical ultrasound, non-destructive testing, and ultrasonic materials processing. The performance of a transducer is a decisive factor that governs the device's range of applicability, efficiency and quality control in the manufacturing. The mechanisms, transmitting fields, performances, and measurement methods used for these transducers have been studied over the past few decades. However, the electroacoustical characterization and measurement methods applied for spherically curved transducers have not been defined in standard documents for either terms or protocols.

This document defines the relevant electroacoustical parameters for these devices and establishes the self-reciprocity measurement method for spherically curved concave focusing transducers.

ULTRASONICS – MEASUREMENTS OF ELECTROACOUSTICAL PARAMETERS AND ACOUSTIC OUTPUT POWER OF SPHERICALLY CURVED TRANSDUCERS USING THE SELF-RECIPROCITY METHOD

1 Scope

This document, which is a Technical Specification,

a) establishes the free-field convergent spherical wave self-reciprocity method for ultrasonic transducer calibration,

b) establishes the measurement conditions and experimental procedure required to determine the transducer's electroacoustic parameters and acoustic output power using the self-reciprocity method,

c) establishes the criteria for checking the reciprocity of these transducers and the linear range of the focused field, and

d) provides guiding information for the assessment of the overall measurement uncertainties for radiation conductance.

This document is applicable to:

1) circular spherically curved concave focusing transducers without a centric hole working in the linear amplitude range,

2) measurements in the frequency range 0,5 MHz to 15 MHz, and

3) acoustic pressure amplitudes in the focused field within the linear amplitude range.

Characterization and sensitivity calibration of hydrophones using the reciprocity method are not addressed in this document but covered in IEC 62127-2 [1][1] and IEC 60565-1 [2].
