CONTENTS

FOREWORD.....	4
INTRODUCTION.....	6
1 Scope.....	8
2 Normative references	8
3 Terms, definitions and abbreviations	8
3.1 Terms and definitions	8
3.2 Abbreviations	11
4 Conformance.....	12
5 Architecture.....	12
5.1 Architectural model	12
5.2 Design philosophy.....	14
5.2.1 General approach.....	14
5.2.2 Distributed gateway system (DGS)	14
5.2.3 Modularity	15
5.2.4 Common interoperability platform	15
6 Modularity requirements	15
7 HES-gateway system	16
7.1 Conceptual process model	16
7.1.1 Common interoperability framework (CIF).....	16
7.1.2 Generic interworking function (GIWF).....	17
7.2 Physical architecture	17
7.3 Modularity	18
7.3.1 General	18
7.3.2 WAN access module.....	19
7.3.3 HAN access module	21
7.3.4 Service module.....	22
7.4 Data flows	23
7.4.1 General	23
7.4.2 Control plane.....	24
7.4.3 Content (data) plane	24
8 Intermediate processes	24
8.1 General	24
8.2 Protocol stacks.....	24
8.2.1 Generalised model	24
8.2.2 Specific model – Simple gateway.....	25
8.2.3 GIWF application	26
8.2.4 Data flow control plane signalling	26
8.3 Intermediate bus (GL bus) and protocol (GL protocol)	27
8.3.1 General	27
8.3.2 Lower layers.....	27
8.3.3 Middle layers	27
8.3.4 Upper layers.....	27
8.4 Gateway management.....	28
Annex A (informative) Case examples	29
A.1 Overview of case examples	29

A.2 VDSL scenario	29
A.3 DBS/DSL scenario.....	30
A.4 Healthcare management scenario	31
A.5 DSL/HomePNA scenario.....	31
Annex B (informative) Intermediate logical bus topologies	33
B.1 Overview of intermediate bus topologies	33
B.2 Mesh topology	33
B.3 Star topology.....	33
B.4 Combined mesh and star topology.....	34
Annex C (informative) Distributed gateway extension methods	35
Bibliography.....	36
Figure 1 – Options for home-gateway configurations.....	8
Figure 2 – Interoperating networks and domain of HES-gateway standard	13
Figure 3 – Alternative distributed modular architectural models.....	14
Figure 4 – Common interoperability framework (CIF)	17

INFORMATION TECHNOLOGY – HOME ELECTRONIC SYSTEM (HES) GATEWAY –

Part 2: Modularity and protocol

FOREWORD

- 1) ISO (International Organization for Standardization) and IEC (International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards. Their preparation is entrusted to technical committees; any ISO and IEC member body interested in the subject dealt with may participate in this preparatory work. International governmental and non-governmental organizations liaising with ISO and IEC also participate in this preparation.
- 2) In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.
- 3) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO member bodies.
- 4) IEC, ISO and ISO/IEC publications have the form of recommendations for international use and are accepted by IEC and ISO member bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC, ISO and ISO/IEC publications is accurate, IEC or ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 5) In order to promote international uniformity, IEC and ISO member bodies undertake to apply IEC, ISO and ISO/IEC publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any ISO/IEC publication and the corresponding national or regional publication should be clearly indicated in the latter.
- 6) ISO and IEC provide no marking procedure to indicate their approval and cannot be rendered responsible for any equipment declared to be in conformity with an ISO/IEC publication.
- 7) All users should ensure that they have the latest edition of this publication.
- 8) No liability shall attach to IEC or ISO or its directors, employees, servants or agents including individual experts and members of their technical committees and IEC or ISO member bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication of, use of, or reliance upon, this ISO/IEC publication or any other IEC, ISO or ISO/IEC publications.
- 9) Attention is drawn to the normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 10) Attention is drawn to the possibility that some of the elements of this International Standard may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

International Standard ISO/IEC 15045-2 was prepared by subcommittee 25: Interconnection of information technology equipment, of ISO/IEC joint technical committee 1: Information technology.

The list of all currently available parts of the ISO/IEC 15045 series, under the general title *Information technology – Home electronic system (HES) gateway*, can be found on the IEC web site.

This International Standard has been approved by vote of the member bodies, and the voting results may be obtained from the address given on the second title page.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

As the market has developed for home systems, the number of communications protocols for home networks and for access to the home has increased. This has occurred even while ISO/IEC standards for these networks have been developed and published. Continuing technological progress also suggests that such proliferation will persist, and that no single technology or standard is likely to prevail.

Therefore, standards to enable interoperability among applications implemented on incompatible networks are being written. This standard addresses the gateway, which provides an interconnection between an access network (a wide area network) and one or more home networks (home area networks).

This standard is part of a series of standards and technical reports for the Home Electronic System (HES) that deal with the topic of control and communication networks in homes and small buildings. ISO/IEC 15045-1, published in 2004, defines a basic model of the residential gateway, including functional requirements.

This standard defines a common framework for implementing gateway platforms to achieve interconnection and interoperability of home system products and applications. The objective is to support products from any manufacturer or provider in a manner that is safe, reliable, predictable and consistent. Service providers such as cable TV companies, Internet service providers and telephone companies are each installing a gateway to deliver digital data and audio/video streams, therefore some houses contain multiple gateways. As a consequence, an optional feature of this standard specifies how to interconnect multiple gateways in one house so that these gateways can co-ordinate service offerings.

A communications gateway provides an interconnection between a wide area network (WAN) and local area network (LAN) where the protocols on each network differ. The gateway is responsible for protocol translation of signals, message formats and timing. The home systems industry has adapted LAN technology for Home Area Networks (HANs). Ideally, each home system would be based on one HAN and all attached devices and appliances would use one communications protocol. In reality, multiple incompatible HAN technologies are being marketed. Also, each service provider is installing a separate gateway (e.g., DSL, cable broadband and satellite). Therefore, it is possible that a user will purchase and install products employing two (or more) dissimilar HANs within the same premises. These HANs may be connected to WANs via separate incompatible gateways. However, the user expects these products and networks to behave as if they were the same logical network in order to deliver home services, such as:

- entertainment (audio/video);
- data/internet access;
- communication (telephony);
- energy management;
- health care and monitoring;
- environmental control (heating and cooling);
- security and safety monitoring;
- appliance telemetry;
- lighting control.

This standard accomplishes interoperability by specifying a modular architecture and set of protocols for interconnecting the modular elements with a common signalling bus. It relies on a common intermediate language to achieve interoperability among applications called the Common Interoperability Framework (HES-CIF), described in this standard. Parts of ISO/IEC 18012 define the network-specific interworking functions needed to provide conforming products.

This International Standard defines a universal gateway system by specifying interfaces between

- standalone local/Home Area Networks (HANs) and connected devices,
- multiple implementations of local/home area networks (HANs) and connected devices,
- Wide Area Networks (WANs) (also known as access networks) and applications connected to Home Area Networks (HANs) and connected devices.

This standard establishes a framework for implementation of a general-purpose interoperability platform or “translator” among home area networks or between wide area networks and home area networks. It represents one approach to implementation of the interoperability standard ISO/IEC 18012. This standard does not attempt to specify a central controller or control system; and does not attempt to improve or resolve disparities or shortcomings among transmission technologies, protocols, or application languages. However, this standard does provide the premises with a platform for supporting any number of specific services and supporting fundamental elements of consumer security (i.e., firewall services), safety and privacy.

This standard is not a design for a specific gateway, but rather it offers an architecture, and therefore it is necessarily abstract. However, this standard is relevant for many commercial gateway configurations. Examples of such implementations are included for information in Annex A.

Summing up, this standard shows how to build a gateway out of modular building blocks. This International Standard does not describe or specify gateway applications, service requirements, network topologies, or how gateways are to be applied within home networks and systems. These specifications are left to other home gateway-related standards.

INFORMATION TECHNOLOGY – HOME ELECTRONIC SYSTEM (HES) GATEWAY –

Part 2: Modularity and protocol

1 Scope

This part of ISO/IEC 15045 specifies a gateway architecture that provides an interconnection between one or more Wide Area Networks (WANs) and one or more Home Area Networks (HANs). This standard is not needed for a “simple gateway” linking one WAN to one HAN where there is no intention of future expansion, as illustrated in Figure 1. The scope of this standard applies to a “distributed gateway,” as illustrated in Figure 1 and is also referred to in ISO/IEC 15045-1 as the Complex Modular Gateway. Also, this standard specifies how separate gateways in a single house can interoperate to provide co-ordinated functions.
