Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: [Foreword - Supplementary information](#)

ISO/IEC 17960, was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*.

Introduction

Source code is written and is used in many critical applications. Knowing that the source code being relied upon is the same as that which was used in testing is vital to ensuring the safety and security of a particular application. Given the ease with which source code can be modified, some method of protecting the integrity and authenticity of the source code is necessary. Sequestration of the source code throughout the supply chain is one possible method, but ensuring protection in that way is impractical and unreliable. Virtual protection through the use of a digital signature offers a practical solution and provides integrity and authentication even though the source code may traverse an insecure supply chain.

Source code may be modified for legitimate reasons as it moves through the supply chain or over time. Modifications to source code may be made to correct the software or to adapt it for other purposes. Modifications may only involve changes to a few lines of code and in most cases is not made by the original author or team of authors. Revision control software facilitates tracking of the software changes, but such tracking can easily be spoofed. The use of a digital signature provides a means to restrict the ability to spoof. Digital code signing assigns a responsible party to each revision of the source code and thus can demonstrate the authenticity of the responsible party, the source code and the software changes that have been made between revisions. By doing this, an electronic pedigree for the source code can be established.

This standard specifies the process for signing source code in order to ensure the integrity and authenticity of the source code and a means for rolling back the source code to signed previous versions. [Clause 5](#) provides an overview of the concepts of code signing. Conformance requirements for this standard are specified in [Clause 6](#). [Annex A](#) is informative and provides a step by step description of a typical application for the standard specified in [Clause 6](#) to assist in understanding code signing. The bibliography lists documents that were referenced during preparation of this standard.

Information technology — Programming languages, their environments and system software interfaces — Code signing for source code

1 Scope

This International Standard specifies a language-neutral and environment-neutral description to define the methodology needed to support the signing of software source code, to enable it to be uniquely identified, and to enable roll-back to signed previous versions. It is intended to be used by originators of software source code and the recipients of their signed source code. This International Standard is designed for transfers of source code among disparate entities.

The following areas are outside the scope of this International Standard:

- Determination of the trust level of a certification authority;
- Format used to track revisions of source code files;
- Digital signing of object or binary code;
- System configuration and resource availability;
- Metadata
 - This is partially addressed by ISO/IEC 19770-2;
- Transmission and representation issues
 - Though this could be an issue in implementation, there are techniques such as Portable Document Format (PDF)¹⁾ that can be used to mitigate these issues. This applies in particular to the transmission of digital signatures.

2 Conformance

An implementation of code signing conforms to this International Standard if it meets the requirements specified in [Clause 6](#).

3 Normative references

The following documents, in whole or in part, are normatively referenced in this standard and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 9594-8:2014, *Information technology — Open Systems Interconnection — The Directory — Part 8: Public-key and attribute certificate frameworks*²⁾

ISO/IEC 10118-3:2004, *Information technology — Security techniques — Hash-functions — Part 3: Dedicated hash functions*

1) ISO 32000-1:2008 Document management — Portable document format — Part 1: PDF 1 specifies a digital form for representing electronic documents to enable users to exchange and view electronic documents independent of the environment in which they were created or the environment in which they are viewed or printed.

2) This is equivalent to ITU-T Recommendation X.509: 2005, “*Information Technology — Open Systems Interconnection — The Directory: Public-Key and attribute certificate frameworks*”

ISO/IEC 17960:2015(E)

ISO/IEC 13888-1:2009, *Information technology — Security techniques — Non-repudiation — Part 1: General*
