Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 35, *User interfaces*.

A list of all parts in the ISO/IEC 22121 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The use of virtual keyboards is becoming a widespread means of input. Due to their virtual nature, they offer unlimited possibilities to interact through different ways. This can potentially generate inconvenience on the user side because from one device to another, and even in the same device, users can be faced with different practices. However, virtual keyboards are also an opportunity for users with disabilities to get a keyboard adapted for their specific needs. There is also the opportunity for all users to use a keyboard that is adapted to be more efficient for a particular application or environment.

A virtual keyboard can be adapted to a specific user (e.g. with visual, motor, cognitive, tactile or hearing constraints), a specific technical context (no physical keyboard available, on a large or a tiny tactile device as a phone, or a large one as a kiosk, or on a TV, etc.), a specific task (e.g. editing big documents, or editing occasionally a password) or a specific context of use (in a hurry, walking, driving, switching between several languages, etc.).

This document provides guidelines for the design of specific keyboards dedicated to specific interaction modes.

Information technology — Virtual keyboards user interfaces —

Part 3: Virtual keyboards interactions

1 Scope

This document provides guidelines on assistive technologies and functionalities that are to be included in accessible virtual keyboards. This document underlines which kinds of interaction modes can be embedded, which kinds of assistive technologies can be easily bound to virtual keyboards, and which kinds of functionalities are to be taken into account within virtual keyboards.

This document does not apply to physical keyboards that use real physical keys or adaptable keys, which can be customized to user needs, for example with LCD display.
