## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)) or the IEC list of patent declarations received (see <http://patents.iec.ch>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 27, *Information security, cybersecurity and privacy protection*.

A list of all parts in the ISO 27035 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

An information security incident can involve ICT or not. For example, information that spreads unintentionally through the loss of paper documents can very well be a serious information security incident, which requires incident reporting, investigation, containment, corrective actions and management involvement. This type of incident management is often carried out, for example, by the Chief Information Security Officer (CISO) within the organization. Guidance on the management of such information security incidents can be found in ISO/IEC 27035-1. This document, however, only considers incident response operations for ICT-related incidents, and not for information security incidents related to paper documents or any other non-ICT incidents. Whenever the term "information security" is used in this document, it is done so in the context of ICT-related information security.

The organizational structures for information security vary depending on the size and business field of organizations. As various and numerous incidents occur and are increasing (such as network incidents, e.g. intrusions, data breaches and hacking), higher concerns about information security have been raised by organizations. A secure ICT environment set up to withstand various types of attacks (such as DoS, worms and viruses) with network security equipment such as firewalls, intrusion detection systems (IDSs) and intrusion prevention systems (IPSs) should be complemented with clear operating procedures for incident handling, along with well-defined reporting structures within the organization.

To ensure confidentiality, integrity and availability of information and to handle incidents efficiently, capabilities to conduct incident response operations is required. For this purpose, a computer security incident response team (CSIRT) should be established to perform tasks such as monitoring, detection, analysis and response activities for collected data or security events. These tasks may be assisted by artificial intelligence tools and techniques.

This document supports the controls of ISO/IEC 27001:2013, Annex A, related to incident management.

Not all steps in this document are applicable since it depends on the particular incident. For example, a smaller organization may not use all guidance in this document but can find it useful for organization of their ICT-related incident operations especially if operating their own ICT environment. It can also be useful for smaller organizations that have outsourced their IT operations to better understand the requirements and execution of incident operations that they should expect from their ICT supplier(s).

This document is particularly useful to organizations providing ICT services that involve interactions between organizations of incident operations in order to follow the same processes and terms.

This document also provides a better understanding on how incident operations relates to the users/customers in order to define when and how such interaction needs to take place, even if this is not specified.

# Information technology — Information security incident management —

## Part 3: Guidelines for ICT incident response operations

### 1 Scope

This document gives guidelines for information security incident response in ICT security operations. This document does this by firstly covering the operational aspects in ICT security operations from a people, processes and technology perspective. It then further focuses on information security incident response in ICT security operations including information security incident detection, reporting, triage, analysis, response, containment, eradication, recovery and conclusion.

This document is not concerned with non-ICT incident response operations such as loss of paper-based documents.

This document is based on the “Detection and reporting” phase, the “Assessment and decision” phase and the “Responses” phase of the “Information security incident management phases” model presented in ISO/IEC 27035-1:2016.

The principles given in this document are generic and intended to be applicable to all organizations, regardless of type, size or nature. Organizations can adjust the provisions given in this document according to their type, size and nature of business in relation to the information security risk situation.

This document is also applicable to external organizations providing information security incident management services.

### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
