INTERNET OF THINGS (IoT) – IoT APPLICATIONS FOR ELECTRONIC LABEL SYSTEM (ELS)

FOREWORD

- 1) ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.
- 2) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO National bodies.
- 3) IEC and ISO documents have the form of recommendations for international use and are accepted by IEC and ISO National bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC and ISO documents is accurate, IEC and ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC and ISO National bodies undertake to apply IEC and ISO documents transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC and ISO document and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC and ISO do not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC and ISO marks of conformity. IEC and ISO are not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this document.
- 7) No liability shall attach to IEC and ISO or their directors, employees, servants or agents including individual experts and members of its technical committees and IEC and ISO National bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this ISO/IEC document or any other IEC and ISO documents.
- 8) Attention is drawn to the Normative references cited in this document. Use of the referenced publications is indispensable for the correct application of this document.
- 9) Attention is drawn to the possibility that some of the elements of this ISO/IEC document may be the subject of patent rights. IEC and ISO shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 30169 has been prepared by subcommittee 41: Internet of Things and Digital Twin, of ISO/IEC joint technical committee 1: Information technology. It is an International Standard.

The text of this International Standard is based on the following documents:

Draft	Report on voting
JTC1-SC41/277/FDIS	JTC1-SC41/287/RVD

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1, available at www.iec.ch/members_experts/refdocs and www.iso.org/directives.

INTRODUCTION

The development of information technology has brought a lot of changes in daily life, especially with the invention and emergence of IoT technology. IoT technology makes things connected with each other, in order to enhance the efficiency, provide effective monitoring and reduce the cost for all the regular management, maintenance, and other business events for those things.

Because of the information explosion era, there is rapid replacement of information, along with the rich variety of the information and the extremely short life cycle of the information. It is very difficult for traditional labels (the paper labels) to adapt to such a quick pace of information updates. Affected by the IoT technology, traditional labels began the process of becoming digitalized and interconnected.

However, the process of promotion and distribution of the electronic label system (ELS) is much faster than the formation of the worldwide marketing regulation system for such a newly emerging IoT application. To help the marketing maintain the operation under a healthy, sustainable, and controllable condition, it is urgent to develop the ELS focused standard(s) to accelerate standardization for the ELS design and distribution. At the same time, the ELS focused standard(s) will actually support the relevant global marketing regulation.

This document is in response to the demand described above. To achieve this goal, the first step is to provide a general design guide, and the overall technical requirements. This document briefly defines the system framework and IoT application model for ELS, which will firstly specify the components of ELS, duties of each component, regulations for business access logic and data flow between adjacent components. Then, the overall requirements in terms of system functions, system interfaces and system performances are specified in this document to simplify and unify the design of ELS. In conclusion, the purpose of this document is to help ensure the quality of service (QoS) and design conformance of ELS in the retail industry.

In order to avoid some unnecessary confusion regarding this document and to distinguish this document from other publications, the core concepts of this document are focused only on the overview and general requirements (discussed above) of the ELS itself.

For example, typical things out of the scope of this document include, but are not limited to,

- a) electronic product labelling,
- b) RFID-specified applications, and
- c) health informatics.

INTERNET OF THINGS (IoT) – IoT APPLICATIONS FOR ELECTRONIC LABEL SYSTEM (ELS)

1 Scope

This document specifies the system framework, IoT application model and overall technical requirements for electronic label system (ELS).

This document applies to the design and development of the IoT applications for ELS.

The IoT applications for ELS specified in this document are mainly applicable to the retail industry, and can also provide reference for the design and development of the IoT applications for ELS in other industries.

2 Normative references

There are no normative references in this document.
