Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and https://patents.iec.ch. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6 *Telecommunications and information exchange between systems*.

A list of all parts in the ISO/IEC 4396 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

This document describes the Error and Flow Control Protocol (EFCP) specification. EFCP is the data transfer protocol of the Recursive InterNetwork Architecture (RINA).[1],[2],[3] It supports a permanent connection with all types of data transfer services.

RINA is a new network architecture based on the idea that networking is inter-process communication (IPC) and only IPC. RINA imposes the strict separation of mechanisms and policies as one of the main architectural features. EFCP assumes that other RINA components are in place and supplies other mechanisms such as addressing and flow allocation, which are outside of its scope.

EFCP[4] is based on the concept of timer-based reliable management of connections.[5],[6] In this way, EFCP operates with a minimum exchange of packets to manage connections and to keep protocol machines involved in a connection synchronised. EFCP uses direct control messages to preserve data from being lost, mis-sequenced or duplicated.

Telecommunications and information exchange between systems — Recursive inter-network architecture —

Part 9:
Error and flow control protocol

1 Scope

This document provides the Error and Flow Control Protocol (EFCP) specification. EFCP provides an inter-process communication (IPC) service to an application process, which can be a (N+1)-IPC process (IPCP), with the requested Quality of Service (QoS). One or more service data units (SDUs) are passed on the (N)-port-id to the (N)-DIF (distributed IPC facility) to be sent to the destination application process. Protocol data units (PDUs) transferred by the (N)-DIF are delivered to the (N)-port-id for the using Application Process. This document describes the placement of EFCP within RINA, the components EFCP consists of, and the mechanisms and policies that are involved in EFCP's work, and the timers and control mechanisms required to manage the connection.

EFCP comprises two logical components, the data transfer procedures (DTP), providing tightly bound mechanisms and the data transfer control procedures (DTCP), which provides loosely bound mechanisms.

This document provides:

— the service definition;

— an overview of EFCP;

— a description of the placement of EFCP within recursive internetwork architecture (RINA);

— the common elements of data transfer protocol (DTP) and data transfer control protocol (DTCP);

— DTP structure and functions;

— DTCP structure and functions;

— an informative list of all policies in EFCP.en
