Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 24, *Computer graphics, image processing and environmental data representation*, in collaboration with Subcommittees SC 29, *Coding of audio, picture, multimedia and hypermedia information*, and SC 36, *Information technology for learning, education and training*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

Virtual, augmented, and mixed reality (VR/AR/MR) systems that are used for education and training require approaches that support systems integration with various industry areas. Because the integration aspects should include common functionalities, unique information modelling requirements are necessary. Use cases for education and training have been reviewed to determine education and training technologies that are in common use and to determine an information model that can be used to support these types of activities supported by VR/AR/MR technologies. This document includes these use cases.

VR/AR/MR based education and training systems have requirements related to learning and teaching approaches, representation, exchange, data, and interaction, in the following ways. First, existing learning and teaching approaches can be integrated with the use of VR/AR/MR technology and form the basis for user interactions with the systems and its elements. Based on differences in learning and teaching methods when using VR/AR/MR, requirements that support interaction and simulation should be included. For example, the use of haptics can be added to support user interaction with the system. Second, visual and interactive representation should be provided to enhance the effectiveness of education and training. Simulation can be an important aspect in representing information and in understanding education and training content. Third, information should be exchangeable over heterogeneous computing environments so that it is accessible to users to support their education and training activities anytime and anywhere. Fourth, education and training information and data should be organized, transferred, stored, and managed securely. Fifth, interfaces for interacting with devices and sensors should be included and should meet the requirements of users.

This document provides requirements and recommendations for developing VR/AR/MR based education and training systems to meet the requirements listed above. The requirements and recommendations include concepts, information modelling architecture, standards based functional components, and implementation components for VR/AR/MR based education and training.

Information technology — Information modelling for virtual, augmented and mixed reality based education and training systems

1 Scope

This document provides requirements and recommendations for developing education and training systems using virtual, augmented and mixed reality (VR/AR/MR) technology. It specifies how to organize the information and data necessary for the development of VR/AR/MR integrated systems for education and training. It includes procedures for the development of VR/AR/MR integrated systems.

This document includes several topics for consideration when developing VR/AR/MR based education and training systems, as follows. First, it defines concepts of VR/AR/MR based education and training. Second, it defines an information modelling architecture for the systems. Third, standards based functional components for the systems are specified. Fourth, framework components for implementing the systems are specified. And, finally, use cases for the systems based on the information modelling architecture are included.

Device hardware technology for education and training systems is excluded from this document.
