Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives) or www.iec.ch/members_experts/refdocs).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents or the IEC list of patent declarations received (see patents.iec.ch). ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 37, *Biometrics*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The purpose of this document is to provide guidance on the use of in-motion biometric recognition technologies in access-related systems, where the previous enrolment and management of the identity of individuals needing access is required.

To satisfy increasing security demands, biometric recognition technologies are used in access-related systems to provide a more robust approach to identity authentication, and to mitigate security risks. However, this can come at a cost of increased processing times and lead to delays in user identification or verification.

Biometric identification and verification should be comprehensive and flexible for effective use in an access-related environment. Solutions should reduce user burden, be easy to manage, cost effective, maintain the security requirements, and provide permission-based access and global interoperability as necessary. Biometric systems should effectively allow authorized users' access, incorporate mechanical and behavioural mechanisms to refer unenrolled persons to human personnel and alert facilities to unauthorized users attempting to gain access. Systems should also provide a seamless, accurate and non-invasive user experience.

Considerable improvements in the performance of in-motion biometric recognition, have resulted in applications that enable automated, convenient and non-intrusive face, iris or fingerprint recognition across a range of scenarios including border control, passenger flow facilitation, access control and work place time and attendance. This provides a positive and non-intrusive user experience, as the user does not need to carry anything or stop and stand still to be recognized and does not need to touch anything.

There are several considerations that are unique to in-motion biometric solutions for design of contactless biometric recognition systems. Design considerations include:

- Selection and placement of biometric data capturing devices (e.g. cameras).
- Control of the flow of individuals requiring access to ensure that only those that are authorized gain access.
- Proximity of capture devices to individuals seeking access for the contactless in-motion capture of the needed information. The proximity of the biometric capture devices can depend on the employed biometric modalities.
- Management of exceptions.
- Mutual placement of capture devices and equipment dedicated to physical access-control (e.g. door, barrier, turnstile).

A number of use cases involving in-motion biometrics address different scenarios including:

- where access is on the basis of the prior enrolment of all individuals well in advance of interacting with the biometric system (identification);
- where access is on the basis of credentials presented just prior to interacting with the biometric system (verification) (e.g. wireless technology, RFID token or a vehicle number plate or any other token available without any interruption to the person's flow of movement).

These scenarios present different challenges to in-motion verification and identification processes.

Critical to the success of biometrics-based secure access is implementation of state-of-the-art data protection technology and procedures (see ISO/IEC 20889^[1] on privacy enhancing data de-identification techniques, according to the privacy principles established in ISO/IEC 29100,^[3] taking into account legal, common practice, business, industry and privacy considerations).

An important factor in in-motion biometric recognition is its ability to sense/detect presentation attacks per ISO/IEC 30107-3.^[5]

Information technology — Biometric recognition of subjects in motion in access-related systems

1 Scope

This document establishes requirements for development of biometric solutions for verification and identification processes for secure access without physical contact with any device at any time. The solution acquires the biometric characteristics that are captured while the data subjects are in motion to verify or identify the individuals requiring access, and thus controlling access using contactless biometrics.
