## Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted (see [www.iso.org/directives](http://www.iso.org/directives) or [www.iec.ch/members\\_experts/refdocs](http://www.iec.ch/members_experts/refdocs)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)) or the IEC list of patent declarations received (see [patents.iec.ch](http://patents.iec.ch)).

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html). In the IEC, see [www.iec.ch/understanding-standards](http://www.iec.ch/understanding-standards).

This document was prepared by the Linux Foundation as Linux Standard Base (LSB): Core specification for X86-32 architecture and drafted in accordance with its editorial rules. It was assigned to Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*, and adopted by National Bodies.

This first edition of ISO/IEC 23360-2-2 cancels and replaces ISO/IEC 23360-2:2006, which has been technically revised.

## Introduction

The LSB defines a binary interface for application programs that are compiled and packaged for LSB-conforming implementations on many different hardware architectures. A binary specification must include information specific to the computer processor architecture for which it is intended. To avoid the complexity of conditional descriptions, the specification has instead been divided into generic parts which are augmented by one of several architecture-specific parts, depending on the target processor architecture; the generic part will indicate when reference must be made to the architecture part, and vice versa.

This document should be used in conjunction with the documents it references. This document enumerates the system components it includes, but descriptions of those components may be included entirely or partly in this document, partly in other documents, or entirely in other reference documents. For example, the section that describes system service routines includes a list of the system routines supported in this interface, formal declarations of the data structures they use that are visible to applications, and a pointer to the underlying referenced specification for information about the syntax and semantics of each call. Only those routines not described in standards referenced by this document, or extensions to those standards, are described in the detail. Information referenced in this way is as much a part of this document as is the information explicitly included here.

The specification carries a version number of either the form  $x.y$  or  $x.y.z$ . This version number carries the following meaning:

1. The first number ( $x$ ) is the major version number. Versions sharing the same major version number shall be compatible in a backwards direction; that is, a newer version shall be compatible with an older version. Any deletion of a library results in a new major version number. Interfaces marked as deprecated may be removed from the specification at a major version change.
2. The second number ( $y$ ) is the minor version number. Libraries and individual interfaces may be added, but not removed. Interfaces may be marked as deprecated at a minor version change. Other minor changes may be permitted at the discretion of the LSB workgroup.
3. The third number ( $z$ ), if present, is the editorial level. Only editorial changes should be included in such versions.

Since this specification is a descriptive Application Binary Interface, and not a source level API specification, it is not possible to make a guarantee of 100% backward compatibility between major releases. However, it is the intent that those parts of the binary interface that are visible in the source level API will remain backward compatible from version to version, except where a feature marked as "Deprecated" in one release may be removed from a future release. Implementors are strongly encouraged to make use of symbol versioning to permit simultaneous support of applications conforming to different releases of this specification.

LSB is a trademark of the Linux Foundation. Developers of applications or implementations interested in using the trademark should see the Linux Foundation Certification Policy for details.

# I Introductory Elements

## 1 Scope

Standard Base (LSB) defines a system interface for compiled applications and a minimal environment for support of installation scripts. Its purpose is to enable a uniform industry standard environment for high-volume applications conforming to the LSB.

These specifications are composed of two basic parts: a common part describing those parts of the interface that remain constant across all implementations of the LSB, and an architecture-specific part describing the parts of the interface that vary by processor architecture. Together, the common part and the relevant architecture-specific part for a single hardware architecture provide a complete interface specification for compiled application programs on systems that share a common hardware architecture.

The LSB contains both a set of Application Program Interfaces (APIs) and Application Binary Interfaces (ABIs). APIs may appear in the source code of portable applications, while the compiled binary of that application may use the larger set of ABIs. A conforming implementation provides all of the ABIs listed here. The compilation system may replace (e.g. by macro definition) certain APIs with calls to one or more of the underlying binary interfaces, and may insert calls to binary interfaces as needed.

The LSB is primarily a binary interface definition. Not all of the source level APIs available to applications may be contained in this specification.

This is the X86 architecture specific part of the Core module of the Linux Standard Base (LSB). This part supplements the common part of the LSB Core module with those interfaces that differ between architectures.

This part should be used in conjunction with LSB Core - Generic, the common part. Whenever a section of the common part is supplemented by architecture-specific information, the common part includes a reference to the architecture-specific part. This part may also contain additional information that is not referenced in the common part.

Interfaces described in this part of the LSB Core Specification are mandatory except where explicitly listed otherwise. Interfaces described in the LSB Core module are supplemented by other LSB modules. All other modules depend on the presence of LSB Core.

### 2.1 Normative References

The following specifications are incorporated by reference into this specification. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced specification (including any amendments) applies.

**Note:** Where copies of a referenced specification are available on the World Wide Web, a Uniform Resource Locator (URL) is given, for informative purposes only. Such URL might at any given time resolve to a more recent copy of the specification, or be out of date (not resolve). Reference copies of specifications at the revision level indicated may be found at the Linux Foundation's Reference Specifications (<http://refspecs.linuxbase.org>) site.

## 3 Requirements

### 3.1 Relevant Libraries

The libraries listed in Table 3-1 shall be available on IA32 Linux Standard Base systems, with the specified runtime names. These names override or supplement the names specified in the generic LSB (LSB Core - Generic) specification. The specified program interpreter, referred to as `proginterp` in this table, shall be used to load the shared libraries specified by `DT_NEEDED` entries at run time.

Table 3-1 Standard Library Names

Library	Runtime Name
libc	libc.so.6
libcrypt	libcrypt.so.1
libdl	libdl.so.2
libgcc_s	libgcc_s.so.1
libm	libm.so.6
libncurses	libncurses.so.5
libncursesw	libncursesw.so.5
libpthread	libpthread.so.0
libstdcxx	libstdc++.so.6
libutil	libutil.so.1
libz	libz.so.1
proginterp	/lib/ld-lsb.so.3

These libraries will be in an implementation-defined directory which the dynamic linker shall search by default.

### 3.2 LSB Implementation Conformance

A conforming implementation is necessarily architecture specific, and must provide the interfaces specified by both the generic LSB Core specification (LSB Core - Generic) and the relevant architecture specific part of the LSB Core Specification.

**Rationale:** An implementation must provide *at least* the interfaces specified in these specifications. It may also provide additional interfaces.

A conforming implementation shall satisfy the following requirements:

- A processor architecture represents a family of related processors which may not have identical feature sets. The architecture specific parts of the LSB Core Specification that supplement this specification for a given target processor architecture describe a minimum acceptable processor. The implementation shall provide all features of this processor, whether in hardware or through emulation transparent to the application.

- The implementation shall be capable of executing compiled applications having the format and using the system interfaces described in this specification.
- The implementation shall provide libraries containing the interfaces specified by this specification, and shall provide a dynamic linking mechanism that allows these interfaces to be attached to applications at runtime. All the interfaces shall behave as specified in this specification.
- The map of virtual memory provided by the implementation shall conform to the requirements of this specification.
- The implementation's low-level behavior with respect to function call linkage, system traps, signals, and other such activities shall conform to the formats described in this specification.
- The implementation shall provide all of the mandatory interfaces in their entirety.
- The implementation may provide one or more of the optional interfaces. Each optional interface that is provided shall be provided in its entirety. The product documentation shall state which optional interfaces are provided.
- The implementation shall provide all files and utilities specified as part of this specification in the format defined here and in other documents normatively included by reference. All commands and utilities shall behave as required by this specification. The implementation shall also provide all mandatory components of an application's runtime environment that are included or referenced in this specification.
- The implementation, when provided with standard data formats and values at a named interface, shall provide the behavior defined for those values and data formats at that interface. However, a conforming implementation may consist of components which are separately packaged and/or sold. For example, a vendor of a conforming implementation might sell the hardware, operating system, and windowing system as separately packaged items.
- The implementation may provide additional interfaces with different names. It may also provide additional behavior corresponding to data values outside the standard ranges, for standard named interfaces.

### 3.3 LSB Application Conformance

A conforming application containing object files is necessarily architecture specific, and must conform to both the generic LSB Core specification (LSB Core - Generic) and the relevant architecture specific part of the LSB Core Specification. A conforming application which contains no object files may be architecture neutral. Architecture neutral applications shall conform only to the requirements of the generic LSB Core specification (LSB Core - Generic).

A conforming application shall satisfy the following requirements:

- Executable files shall be either object files in the format defined in the Object Format section of this specification, or script files in a scripting language where the interpreter is required by this specification.
- Object files shall participate in dynamic linking as defined in the Program Loading and Linking section of this specification.
- Object files shall employ only the instructions, traps, and other low-level facilities defined as being for use by applications in the Low-Level System Information section of this specification

- If the application requires any optional interface defined in this specification in order to be installed or to execute successfully, the requirement for that optional interface shall be stated in the application's documentation.
- The application shall not use any interface or data format that is not required to be provided by a conforming implementation, unless such an interface or data format is supplied by another application through direct invocation of that application during execution. The other application must also be a conforming application, and the use of such interface or data format, as well as its source (in other words, the other conforming application), shall be identified in the documentation of the application.
- The application shall not use any values for a named interface that are reserved for vendor extensions.

A strictly conforming application shall not require or use any interface, facility, or implementation-defined extension not defined in this specification in order to be installed or to execute successfully.

## 4 Terms and Definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 2382, ISO 80000-2, and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

### 4.1

#### **archLSB**

Some LSB specification documents have both a generic, architecture-neutral part and an architecture-specific part. The latter describes elements whose definitions may be unique to a particular processor architecture. The term archLSB may be used in the generic part to refer to the corresponding section of the architecture-specific part.

### 4.2

#### **Binary Standard, ABI**

The total set of interfaces that are available to be used in the compiled binary code of a conforming application, including the run-time details such as calling conventions, binary format, C++ name mangling, etc.

### 4.3

#### **Implementation-defined**

Describes a value or behavior that is not defined by this document but is selected by an implementor. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations. The implementor shall document such a value or behavior so that it can be used correctly by an application.

### 4.4

#### **Shell Script**

A file that is read by an interpreter (e.g., awk). The first line of the shell script includes a reference to its interpreter binary.

## 4.5

### Source Standard, API

The total set of interfaces that are available to be used in the source code of a conforming application. Due to translations, the Binary Standard and the Source Standard may contain some different interfaces.

## 4.6

### Undefined

Describes the nature of a value or behavior not defined by this document which results from use of an invalid program construct or invalid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

## 4.7

### Unspecified

Describes the nature of a value or behavior not specified by this document which results from use of a valid program construct or valid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

In addition, for the portions of this specification which build on IEEE Std 1003.1-2001, the definitions given in *IEEE Std 1003.1-2001, Base Definitions, Chapter 3* apply.

## 5 Documentation Conventions

Throughout this document, the following typographic conventions are used:

`function()`

the name of a function

**command**

the name of a command or utility

CONSTANT

a constant value

*parameter*

a parameter

variable

a variable

Throughout this specification, several tables of interfaces are presented. Each entry in these tables has the following format:

name

the name of the interface

(symver)

An optional symbol version identifier, if required.

[*refno*]

A reference number indexing the table of referenced specifications that follows this table.

For example,

forkpty(GLIBC_2.0) [SUSv4]
----------------------------

refers to the interface named `forkpty()` with symbol version `GLIBC_2.0` that is defined in the reference indicated by the tag `SUSv4`.

**Note:** For symbols with versions which differ between architectures, the symbol versions are defined in the architecture specific parts of of this module specification only. In the generic part, they will appear without symbol versions.

## **II Executable and Linking Format (ELF)**

## 6 Introduction

Executable and Linking Format (ELF) defines the object format for compiled applications. This specification supplements the information found in System V ABI Update and System V ABI, IA32 Supplement, and is intended to document additions made since the publication of that document.

## 7 Low Level System Information

### 7.1 Machine Interface

#### 7.1.1 Processor Architecture

The IA32 Architecture is specified by the following documents

- Intel® Architecture Software Developer's Manual Volume 1
- Intel® Architecture Software Developer's Manual Volume 2
- Intel® Architecture Software Developer's Manual Volume 3

Only the features of the Intel486 processor instruction set may be assumed to be present. An application should determine if any additional instruction set features are available before using those additional features. If a feature is not present, then a conforming application shall not use it.

Conforming applications may use only instructions which do not require elevated privileges.

Conforming applications shall not invoke the implementations underlying system call interface directly. The interfaces in the implementation base libraries shall be used instead.

**Rationale:** Implementation-supplied base libraries may use the system call interface but applications must not assume any particular operating system or kernel version is present.

Applications conforming to this specification shall provide feedback to the user if a feature that is required for correct execution of the application is not present. Applications conforming to this specification should attempt to execute in a diminished capacity if a required instruction set feature is not present.

This specification does not provide any performance guarantees of a conforming system. A system conforming to this specification may be implemented in either hardware or software.

#### 7.1.2 Data Representation

LSB-conforming applications shall use the data representation as defined in Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.1.2.1 Byte Ordering

LSB-conforming systems and applications shall use the bit and byte ordering rules specified in Section 1.3.1 of the Intel® Architecture Software Developer's Manual Volume 1.

##### 7.1.2.2 Fundamental Types

In addition to the fundamental types specified in Chapter 3 of the System V ABI, IA32 Supplement, a 64 bit data type is defined here.

Table 7-1 Scalar Types

Type	C	sizeof	Alignment (bytes)	Intel386 Architecture
Integral	long long	8	4	signed double word

Type	C	sizeof	Alignment (bytes)	Intel386 Architecture
	signed long long			
	unsigned long long	8	4	unsigned double word

### 7.1.2.3 Aggregates and Unions

LSB-conforming implementations shall support aggregates and unions with alignment and padding as specified in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.1.2.4 Bit Fields

LSB-conforming implementations shall support structure and union definitions that include bit-fields as specified in Chapter 3 of the System V ABI, IA32 Supplement.

## 7.2 Function Calling Sequence

LSB-conforming applications shall use the function calling sequence as defined in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.2.1 Registers

LSB-conforming applications shall use the general registers provided by the architecture in the manner described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.2.2 Floating Point Registers

LSB-conforming applications shall use the floating point registers provided by the architecture in the manner described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.2.3 Stack Frame

LSB-conforming applications shall use the stack frame in the manner specified in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.2.4 Arguments

#### 7.2.4.1 Integral/Pointer

Integral and pointer arguments to functions shall be passed as specified in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.2.4.2 Floating Point

Floating point arguments to functions shall be passed as specified in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.2.4.3 Struct and Union Arguments

Structure and union arguments to functions shall be passed as specified in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.2.4.4 Variable Arguments

As described in Chapter 3 of the System V ABI, IA32 Supplement, LSB-conforming applications using variable argument lists shall use the facilities defined in the header file `<stdarg.h>` to deal with variable argument lists.

**Note:** This is a requirement of ISO C (1999) and POSIX 1003.1-2008 (ISO/IEC 9945-2009) as well as System V ABI, IA32 Supplement.

#### 7.2.5 Return Values

##### 7.2.5.1 Void

As described in chapter 3 of System V ABI, IA32 Supplement, functions returning no value need not set any register to any particular value.

##### 7.2.5.2 Integral/Pointer

Functions return scalar values (integer or pointer), shall do so as specified in Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.2.5.3 Floating Point

Functions return floating point values shall do so as specified in Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.2.5.4 Struct and Union

Functions that return a structure or union shall do so as specified in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.3 Operating System Interface

LSB-conforming applications shall use the following aspects of the Operating System Interfaces as defined in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.3.1 Virtual Address Space

LSB-conforming implementations shall support the virtual address space described in Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.3.1.1 Page Size

LSB-conforming applications should call `sysconf()` to determine the current page size. See also Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.3.1.2 Virtual Address Assignments

LSB-conforming systems shall provide the virtual address space configuration as described in Chapter 3 of the System V ABI, IA32 Supplement (Virtual Address Assignments).

##### 7.3.1.3 Managing the Process Stack

LSB-conforming systems shall manage the process stack as specified in Chapter 3 of the System V ABI, IA32 Supplement.

##### 7.3.1.4 Coding Guidelines

LSB-conforming applications should follow the coding guidelines provided in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.3.2 Processor Execution Mode

LSB-conforming applications shall run in the user-mode ring as described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.3.3 Exception Interface

#### 7.3.3.1 Introduction

LSB-conforming system shall provide the exception interface described in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.3.3.2 Hardware Exception Types

LSB-conforming systems shall map hardware exceptions to signals as described in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.3.3.3 Software Trap Types

Software generated traps are subject to the limitations described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.3.4 Signal Delivery

There are no architecture specific requirements for signal delivery.

#### 7.3.4.1 Signal Handler Interface

There are no architecture specific requirements for the signal handler interface.

## 7.4 Process Initialization

An LSB-conforming implementation shall cause an application to be initialized as described in the Process Initialization section of Chapter 3 of the System V ABI, IA32 Supplement, and as described below.

### 7.4.1 Special Registers

The special registers shall be initialized as described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.4.2 Process Stack (on entry)

The process stack shall be initialized as described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.4.3 Auxilliary Vector

The auxilliary vector shall be initialized as described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.4.4 Environment

There are no architecture specific requirements for environment initialization.

## 7.5 Coding Examples

### 7.5.1 Introduction

LSB-conforming applications may follow the coding examples provided in chapter 3 of the System V ABI, IA32 Supplement in order to implement certain fundamental operations.

### 7.5.2 Code Model Overview/Architecture Constraints

Chapter 3 of the System V ABI, IA32 Supplement provides an overview of the code model.

### 7.5.3 Position-Independent Function Prologue

LSB-conforming applications using position independent functions may use the techniques described in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.5.4 Data Objects

LSB-conforming applications accessing non-stack resident data objects may do so as described in Chapter 3 of the System V ABI, IA32 Supplement, including both absolute and position independent data access techniques.

### 7.5.5 Function Calls

#### 7.5.5.1 Absolute Direct Function Call

LSB-conforming applications using direct function calls with absolute addressing may follow the examples given in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.5.5.2 Absolute Indirect Function Call

LSB-conforming applications using indirect function calls with absolute addressing may follow the examples given in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.5.5.3 Position-Independent Direct Function Call

LSB-conforming applications using direct function calls with position independent addressing may follow the examples given in Chapter 3 of the System V ABI, IA32 Supplement.

#### 7.5.5.4 Position-Independent Indirect Function Call

LSB-conforming applications using indirect function calls with position independent addressing may follow the examples given in Chapter 3 of the System V ABI, IA32 Supplement.

### 7.5.6 Branching

LSB-conforming applications may follow the branching examples given in Chapter 3 of the System V ABI, IA32 Supplement.

## 7.6 C Stack Frame

### 7.6.1 Variable Argument List

As described in Chapter 3 of the System V ABI, IA32 Supplement, LSB-conforming applications using variable argument lists shall use the facilities defined in the header file `<stdarg.h>` to deal with variable argument lists.

**Note:** This is a requirement of ISO C (1999) and POSIX 1003.1-2008 (ISO/IEC 9945-2009) as well as System V ABI, IA32 Supplement.

### 7.6.2 Dynamic Allocation of Stack Space

LSB-conforming applications may allocate space using the stack following the examples given in Chapter 3 of the System V ABI, IA32 Supplement.

## 7.7 Debug Information

There are no architecture specific requirements for debugging information for this architecture. LSB-conforming applications may utilize DWARF sections as described in the generic specification.

## 8 Object Format

### 8.1 Introduction

LSB-conforming implementations shall support the Executable and Linking Format (ELF) object file format, as defined by the following documents:

- System V ABI
- System V ABI Update
- System V ABI, IA32 Supplement
- LSB Core - Generic
- this document

### 8.2 ELF Header

#### 8.2.1 Machine Information

LSB-conforming applications shall use the Machine Information as defined in Chapter 4 of the System V ABI, IA32 Supplement, including the *e\_ident* array members for *EI\_CLASS* and *EI\_DATA*, the processor identification in *e\_machine* and flags in *e\_flags*. The operating system identification field, in *e\_ident[EI\_OSABI]* shall be *ELFOSABI\_NONE* (0).

### 8.3 Special Sections

#### 8.3.1 Special Sections

Various sections hold program and control information. Sections in the lists below are used by the system and have the indicated types and attributes.

##### 8.3.1.1 ELF Special Sections

The following sections are defined in Chapter 4 of the System V ABI, IA32 Supplement.

Table 8-1 ELF Special Sections

Name	Type	Attributes
.got	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.plt	SHT_PROGBITS	SHF_ALLOC+SHF_EX- ECINSTR

.got

This section holds the global offset table. See 'Coding Examples' in Chapter 3, 'Special Sections' in Chapter 4, and 'Global Offset Table' in Chapter 5 of the processor supplement for more information.

.plt

This section holds the procedure linkage table.

##### 8.3.1.2 Additional Special Sections

The following additional sections are defined here.

Table 8-2 Additional Special Sections

Name	Type	Attributes
.rel.dyn	SHT_REL	SHF_ALLOC

.rel.dyn

This section holds relocation information, as described in 'Relocation' section in Chapter 4 of System V ABI Update. These relocations are applied to the .dyn section.

## 8.4 Symbol Table

LSB-conforming applications shall use the Symbol Table section as defined in Chapter 4 of the System V ABI, IA32 Supplement.

## 8.5 Relocation

### 8.5.1 Introduction

LSB-conforming implementations shall support Relocation as defined in Chapter 4 of the System V ABI, IA32 Supplement and as described below.

### 8.5.2 Relocation Types

The relocation types described in Chapter 4 of the System V ABI, IA32 Supplement shall be supported.

## 9 Program Loading and Dynamic Linking

### 9.1 Introduction

LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the System V ABI , System V ABI Update , System V ABI, IA32 Supplement and as supplemented by LSB Core - Generic and the generic LSB specification.

### 9.2 Program Header

#### 9.2.1 Introduction

As described in System V ABI Update, the program header is an array of structures, each describing a segment or other information the system needs to prepare the program for execution.

#### 9.2.2 Types

The IA32 architecture does not define any additional program header types beyond those required in the generic LSB Core specification.

#### 9.2.3 Flags

The IA32 architecture does not define any additional program header flags beyond those required in the generic LSB Core specification.

### 9.3 Program Loading

LSB-conforming systems shall support program loading as defined in Chapter 5 of the System V ABI, IA32 Supplement.

### 9.4 Dynamic Linking

LSB-conforming systems shall support dynamic linking as defined in Chapter 5 of the System V ABI, IA32 Supplement.

#### 9.4.1 Dynamic Section

The following dynamic entries are defined in the System V ABI, IA32 Supplement.

DT\_PLTGOT

On the Intel386 architecture, this entry's `d_ptr` member gives the address of the first entry in the global offset table.

#### 9.4.2 Global Offset Table

LSB-conforming implementations shall support use of the global offset table as described in Chapter 5 of the System V ABI, IA32 Supplement.

#### 9.4.3 Shared Object Dependencies

There are no architecture specific requirements for shared object dependencies; see the generic LSB-Core specification.

#### 9.4.4 Function Addresses

Function addresses shall behave as specified in Chapter 5 of the System V ABI, IA32 Supplement.

#### **9.4.5 Procedure Linkage Table**

LSB-conforming implementations shall support a Procedure Linkage Table as described in Chapter 5 of the System V ABI, IA32 Supplement.

#### **9.4.6 Initialization and Termination Functions**

There are no architecture specific requirements for initialization and termination functions; see the generic LSB-Core specification.

## III Base Libraries

## 10 Libraries

An LSB-conforming implementation shall support base libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

Only interfaces and interface details which are unique to the X86 platform are defined here. This section should be used in conjunction with the corresponding section of LSB Core - Generic.

### 10.1 Program Interpreter/Dynamic Linker

The Program Interpreter shall be `/lib/ld-lsb.so.3`.

### 10.2 Interfaces for libc

Table 10-1 defines the library name and shared object name for the libc library

**Table 10-1 libc Definition**

Library:	libc
SONAME:	libc.so.6

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support  
 [LSB] LSB Core - Generic  
 [RPC + XDR] RFC 5531/4506 RPC & XDR  
 [SUSv2] SUSv2  
 [SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)  
 [SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)  
 [SVID.4] SVID Issue 4

#### 10.2.1 RPC

##### 10.2.1.1 Interfaces for RPC

An LSB conforming implementation shall provide the architecture specific functions for RPC specified in Table 10-2, with the full mandatory functionality as described in the referenced underlying specification.

**Table 10-2 libc - RPC Function Interfaces**

<code>authnone_create(GLIBC_2.0)</code> [SVID.4]	<code>callrpc(GLIBC_2.0)</code> [RPC + XDR]	<code>clnt_create(GLIBC_2.0)</code> [SVID.4]	<code>clnt_pcreateerror(GLIBC_2.0)</code> [SVID.4]

## 10.2.2 Epoll

### 10.2.2.1 Interfaces for Epoll

No external functions are defined for libc - Epoll in this part of the specification. See also the generic specification.

## 10.2.3 System Calls

### 10.2.3.1 Interfaces for System Calls

An LSB conforming implementation shall provide the architecture specific functions for System Calls specified in Table 10-4, with the full mandatory functionality as described in the referenced underlying specification.

## 10.2.22 GNU Extensions for libc

### 10.2.22.1 Interfaces for GNU Extensions for libc

An LSB conforming implementation shall provide the architecture specific functions for GNU Extensions for libc specified in Table 10-35, with the full mandatory functionality as described in the referenced underlying specification.

## 10.3 Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 10.4 Interface Definitions for libc

The interfaces defined on the following pages are included in libc and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 10.2 shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

### ioperm

#### Name

ioperm – set port input/output permissions

#### Synopsis

```
#include <sys/io.h> /* for glibc */
```

```
int ioperm(unsigned long from, unsigned long num, int turn_on);
```

### Description

`ioperm` sets the port access permission bits for the process for `num` bytes starting from port address `from` to the value `turn_on`. The use of `ioperm` requires root privileges.

Only the first 0x3ff I/O ports can be specified in this manner. For more ports, the `iopl` function must be used. Permissions are not inherited on fork, but on exec they are. This is useful for giving port access permissions to non-privileged tasks.

### Return Value

On success, zero is returned. On error, -1 is returned, and `errno` is set appropriately.

### Notes

Libc5 treats it as a system call and has a prototype in `<unistd.h>`. Glibc1 does not have a prototype. Glibc2 has a prototype both in `<sys/io.h>` and in `<sys/perm.h>`. Avoid the latter, it is available on i386 only.

## iopl

### Name

`iopl` – change I/O privilege level

### Synopsis

```
#include <sys/io.h> /* for glibc */
```

```
int iopl(int level);
```

## Description

`iopl` changes the I/O privilege level of the current process, as specified in `level`.

This call is necessary to allow 8514-compatible X servers to run under Linux. Since these X servers require access to all 65536 I/O ports, the `ioperm` call is not sufficient.

In addition to granting unrestricted I/O port access, running at a higher I/O privilege level also allows the process to disable interrupts. This will probably crash the system, and is not recommended.

Permissions are inherited by `fork` and `exec`.

The I/O privilege level for a normal process is 0.

## Return Value

On success, zero is returned. On error, -1 is returned, and `errno` is set appropriately.

## Errors

EINVAL

`level` is greater than 3.

EPERM

The current user is not the super-user.

## 10.5 Interfaces for libm

Table 10-36 defines the library name and shared object name for the `libm` library

**Table 10-36 libm Definition**

Library:	libm
SONAME:	libm.so.6

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] LSB Core - Generic

[SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

### 10.5.1 Math

#### 10.5.1.1 Interfaces for Math

## 10.6 Data Definitions for libm

This section defines global identifiers and their values that are associated with interfaces contained in libm. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 10.7 Interface Definitions for libm

The interfaces defined on the following pages are included in libm and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 10.5 shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

## \_\_fpclassifyf

### Name

`__fpclassifyf` – Classify real floating type

### Synopsis

```
int __fpclassifyf(long double arg);
```

### Description

`__fpclassifyf()` has the same specification as `fpclassify()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__fpclassifyf()` is known to be long double.

`__fpclassifyf()` is not in the source standard; it is only in the binary standard.

## \_\_signbitl

### Name

`__signbitl` – test sign of floating point value

### Synopsis

```
#include <math.h>
int __signbitl(long double arg);
```

### Description

`__signbitl()` has the same specification as `signbit()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__signbitl()` is known to be long double.

`__signbitl()` is not in the source standard; it is only in the binary standard.

## 10.8 Interfaces for libpthread

Table 10-40 defines the library name and shared object name for the libpthread library

**Table 10-40 libpthread Definition**

Library:	libpthread
SONAME:	libpthread.so.0

The behavior of the interfaces in this library is specified by the following specifications:

## 10.9 Data Definitions for libpthread

This section defines global identifiers and their values that are associated with interfaces contained in libpthread. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content.

Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

## 10.12 Interface Definitions for libgcc\_s

The interfaces defined on the following pages are included in libgcc\_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 10.10 shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

### **`_Unwind_Find_FDE`**

#### **Name**

`_Unwind_Find_FDE` — private C++ error handling method

#### **Synopsis**

```
fde * _Unwind_Find_FDE(void * pc, struct dwarf_eh_bases * bases);
```

#### **Description**

`_Unwind_Find_FDE()` looks for the object containing `pc`, then inserts into `bases`.

### **`_Unwind_GetDataRelBase`**

#### **Name**

`_Unwind_GetDataRelBase` — private IA64 C++ error handling method

#### **Synopsis**

```
_Unwind_Ptr _Unwind_GetDataRelBase(struct _Unwind_Context * context);
```

#### **Description**

`_Unwind_GetDataRelBase()` returns the global pointer in register one for `context`.

## **\_Unwind\_GetTextRelBase**

### **Name**

`_Unwind_GetTextRelBase` — private IA64 C++ error handling method

### **Synopsis**

```
_Unwind_Ptr _Unwind_GetTextRelBase(struct _Unwind_Context * context);
```

### **Description**

`_Unwind_GetTextRelBase()` calls the abort method, then returns.

**12.1.149 Class \_\_gnu\_cxx::\_\_pool<false>****12.1.149.1 Interfaces for Class \_\_gnu\_cxx::\_\_pool<false>**

An LSB conforming implementation shall provide the architecture specific methods for Class \_\_gnu\_cxx::\_\_pool<false> specified in Table 12-236, with the full mandatory functionality as described in the referenced underlying specification.

Table 12-236 libstdcxx - Class \_\_gnu\_cxx::\_\_pool<false> Function Interfaces

<code>__gnu_cxx::__pool&lt;false&gt;::_M_reclaim_block(char*, unsigned int)(GLIBCXX_3.4.4) [LSB]</code>
<code>__gnu_cxx::__pool&lt;false&gt;::_M_reserve_block(unsigned int, unsigned int)(GLIBCXX_3.4.4) [LSB]</code>

**12.1.150 Class \_\_gnu\_cxx::free\_list****12.1.150.1 Interfaces for Class \_\_gnu\_cxx::free\_list**

An LSB conforming implementation shall provide the architecture specific methods for Class \_\_gnu\_cxx::free\_list specified in Table 12-237, with the full mandatory functionality as described in the referenced underlying specification.

Table 12-237 libstdcxx - Class \_\_gnu\_cxx::free\_list Function Interfaces

<code>__gnu_cxx::free_list::_M_get(unsigned int)(GLIBCXX_3.4.4) [LSB]</code>

## 12.1.151 Class locale::\_Impl

### 12.1.151.1 Interfaces for Class locale::\_Impl

An LSB conforming implementation shall provide the architecture specific methods for Class std::locale::\_Impl specified in Table 12-238, with the full mandatory functionality as described in the referenced underlying specification.

**Table 12-238 libstdcxx - Class locale::\_Impl Function Interfaces**

<pre>locale::_Impl::_M_install_cache(locale::facet const*, unsigned int)(GLIBCXX_3.4.7) [ISOCXX]</pre>

## 12.1.152 Namespace std Functions

### 12.1.152.1 Interfaces for Namespace std Functions

An LSB conforming implementation shall provide the architecture specific methods for Namespace std Functions specified in Table 12-239, with the full mandatory functionality as described in the referenced underlying specification.

**Table 12-239 libstdcxx - Namespace std Functions Function Interfaces**

<pre>int __copy_streambufs&lt;char, char_traits&lt;char&gt; &gt;(basic_streambuf&lt;char, char_traits&lt;char&gt; &gt;*, basic_streambuf&lt;char, char_traits&lt;char&gt; &gt;*)(GLIBCXX_3.4.6) [ISOCXX]</pre>

## 12.1.153 Class char\_traits<char>

### 12.1.153.1 Interfaces for Class char\_traits<char>

No external methods are defined for libstdcxx - Class std::char\_traits<char> in this part of the specification. See also the generic specification.

## 12.1.154 Class char\_traits<wchar\_t>

### 12.1.154.1 Interfaces for Class char\_traits<wchar\_t>

No external methods are defined for libstdcxx - Class std::char\_traits<wchar\_t> in this part of the specification. See also the generic specification.

## 12.2 Interface Definitions for libstdcxx

The interfaces defined on the following pages are included in libstdcxx and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 12.1 shall behave as described in the referenced base document. For interfaces referencing LSB and not listed below, please see the generic part of the specification.

## **VI Package Format and Installation**

## 13 Software Installation

### 13.1 Package Dependencies

The LSB runtime environment shall provide the following dependencies.

`lsb-core-ia32`

This dependency is used to indicate that the application is dependent on features contained in the LSB-Core specification.

This dependency shall have a version of 5.0.

Other LSB modules may add additional dependencies; such dependencies shall have the format `lsb-module-ia32`.

### 13.2 Package Architecture Considerations

All packages must specify an architecture of `i486`. A LSB runtime environment must accept an architecture of `i486` even if the native architecture is different.

The `archnum` value in the Lead Section shall be `0x0001`.

## Annex A Alphabetical Listing of Interfaces by Library

### A.1 libc

The behavior of the interfaces in this library is specified by the following Standards.

Large File Support [LFS]  
 LSB Core - Generic [LSB]  
 RFC 5531/4506 RPC & XDR [RPC + XDR]  
 SUSv2 [SUSv2]  
 POSIX 1003.1-2001 (ISO/IEC 9945-2003) [SUSv3]  
 POSIX 1003.1-2008 (ISO/IEC 9945-2009) [SUSv4]  
 SVID Issue 4 [SVID.4]
